## PREFACE

A pre-requisite to the use of this manual is a familiarity with both the DEC/X11 SYSTEM EXERCISER USER'S MANUAL and the XXDP+ USER'S MANUAL.

The material in this manual is primarily intended to provide DEC/X11 users with all of the cross-reference data required to successfully create user designed Run Time Exerciser (RTE) programs for PDP11 systems. However, supplementary information is also provided concerning the naming, distribution, revision, and release of all DEC/X11 software. The material is arranged in four sections, which contain the following.

- Section 1 defines the naming standards and conventions for all DEC/X11 software.
- Section 2 provides the user with all of the information required to use the cross-reference data contained in this manual for the construction of an RTE. Toward this end, the section includes a complete example of the implementation of a pre-build plan.
- Section 3 provides the user with all of the actual cross-reference data required to complete a build.
- Section 4 contains all of the supplementary information regarding the distribution, revision, release and special environmental considerations for all DEC/X11 software.
- Section 5 is the Bibliography.
- Section 6 is the Glossary.
- Appendix A provides the user with a sample build from pre-build planning through the actual build under the Configurator/Linker program.
- Appendix B Defines the ERROR TYPE (ERRTYP) CODES.

## 1.0 NAMING CONVENTIONS

The naming of DEC/X11 software adheres to the following conventions and standards.

### 1.1 Monitor Naming

Each Monitor Name consists of a single alphabetic character (i.e., A, B, C, etc.).

### 1.2 Device/Option Module Naming

The format of each Module Name consists of three alphabetic characters:

Module Name: WYZ

Where: WY - is a two-character device/option identifier

Z - is a module specifier (since others may exist for the same device/option).

### 1.3 File Code Naming

The File Code format consists of a six-character descriptor and a three-character file extension code. The names appear on both paper tapes and mass media for file identification (e.g., monitor library, RTE module, etc.). NOTE: The File Code must be as follows for a .OBJ file:

File Code: XWYZR0.OBJ

Where: X - DEC/X11 Software Identifier

WYZ - Module Name (See 1.2)

R - Revision Level (Alphabetic)

0 - Patch Level (must always be 0 for .OBJ files)

.OBJ - File Extension Code (.OBJ, .LIB, .BIN or .BIC)

#### 1.4 Package Code Naming

The Package Code format is used to identify a diagnostic software package (ZZ) as DEC/X11 software (X).

Package Code: ZZ - CXWYZR0  
Where: ZZ - Diagnostic Software Identifier  
C - PDP-11 CPU identifier  
X - DEC/X11 Software Identifier  
WYZ - Module Name (See 1.2)  
R - Revision Level (Alphabetic)  
0 - Patch Level (Numeric)

### 2.0 USING THE CROSS-REFERENCE DATA

Data for respectively cross-referencing CPU and device hardware with the appropriate monitor and device option modules is contained in Section 3 (HARDWARE TO SOFTWARE CROSS-REFERENCE DATA).

However, for the inexperienced user of DEC/X11 software, the following material will reiterate the basic build requirements previously defined in the DEC/X11 User's Manual (refer to Subsection 3.2.2 PRE-BUILD PLANNING). This is followed by an example of data listing for a build associated with a typical PDP-11 system configuration in which: (1) a unique file name is created for the resultant RTE, (2) both monitor and test module names are derived, along with appropriate parameter values, for the Configuration Table (C-Table), and (3) an appropriate Configurator/Linker Program is selected for the build.

#### 2.1 RTE Pre-Build Requirements

As described in PRE-BUILD PLANNING, Step 1, the user is advised to note (from related hardware documentation) the major components, options, and parameters of the system to be tested, that is:

- The PDP-11 CPU type and memory size.
- All available CPU Memory Options (KT, CACHE, etc.)
- All available devices and options (Line Clock, Floating Point Hardware, etc.)
- All device parameters (DVA, VCT, baud rates, etc.).

With this information the user is then ready to implement Step 2 of the pre-build plan by cross-referencing the known hardware data with the DEC/X11 software data contained in Section 3 and listing the information on a DEC/X11 System Configuration worksheet.

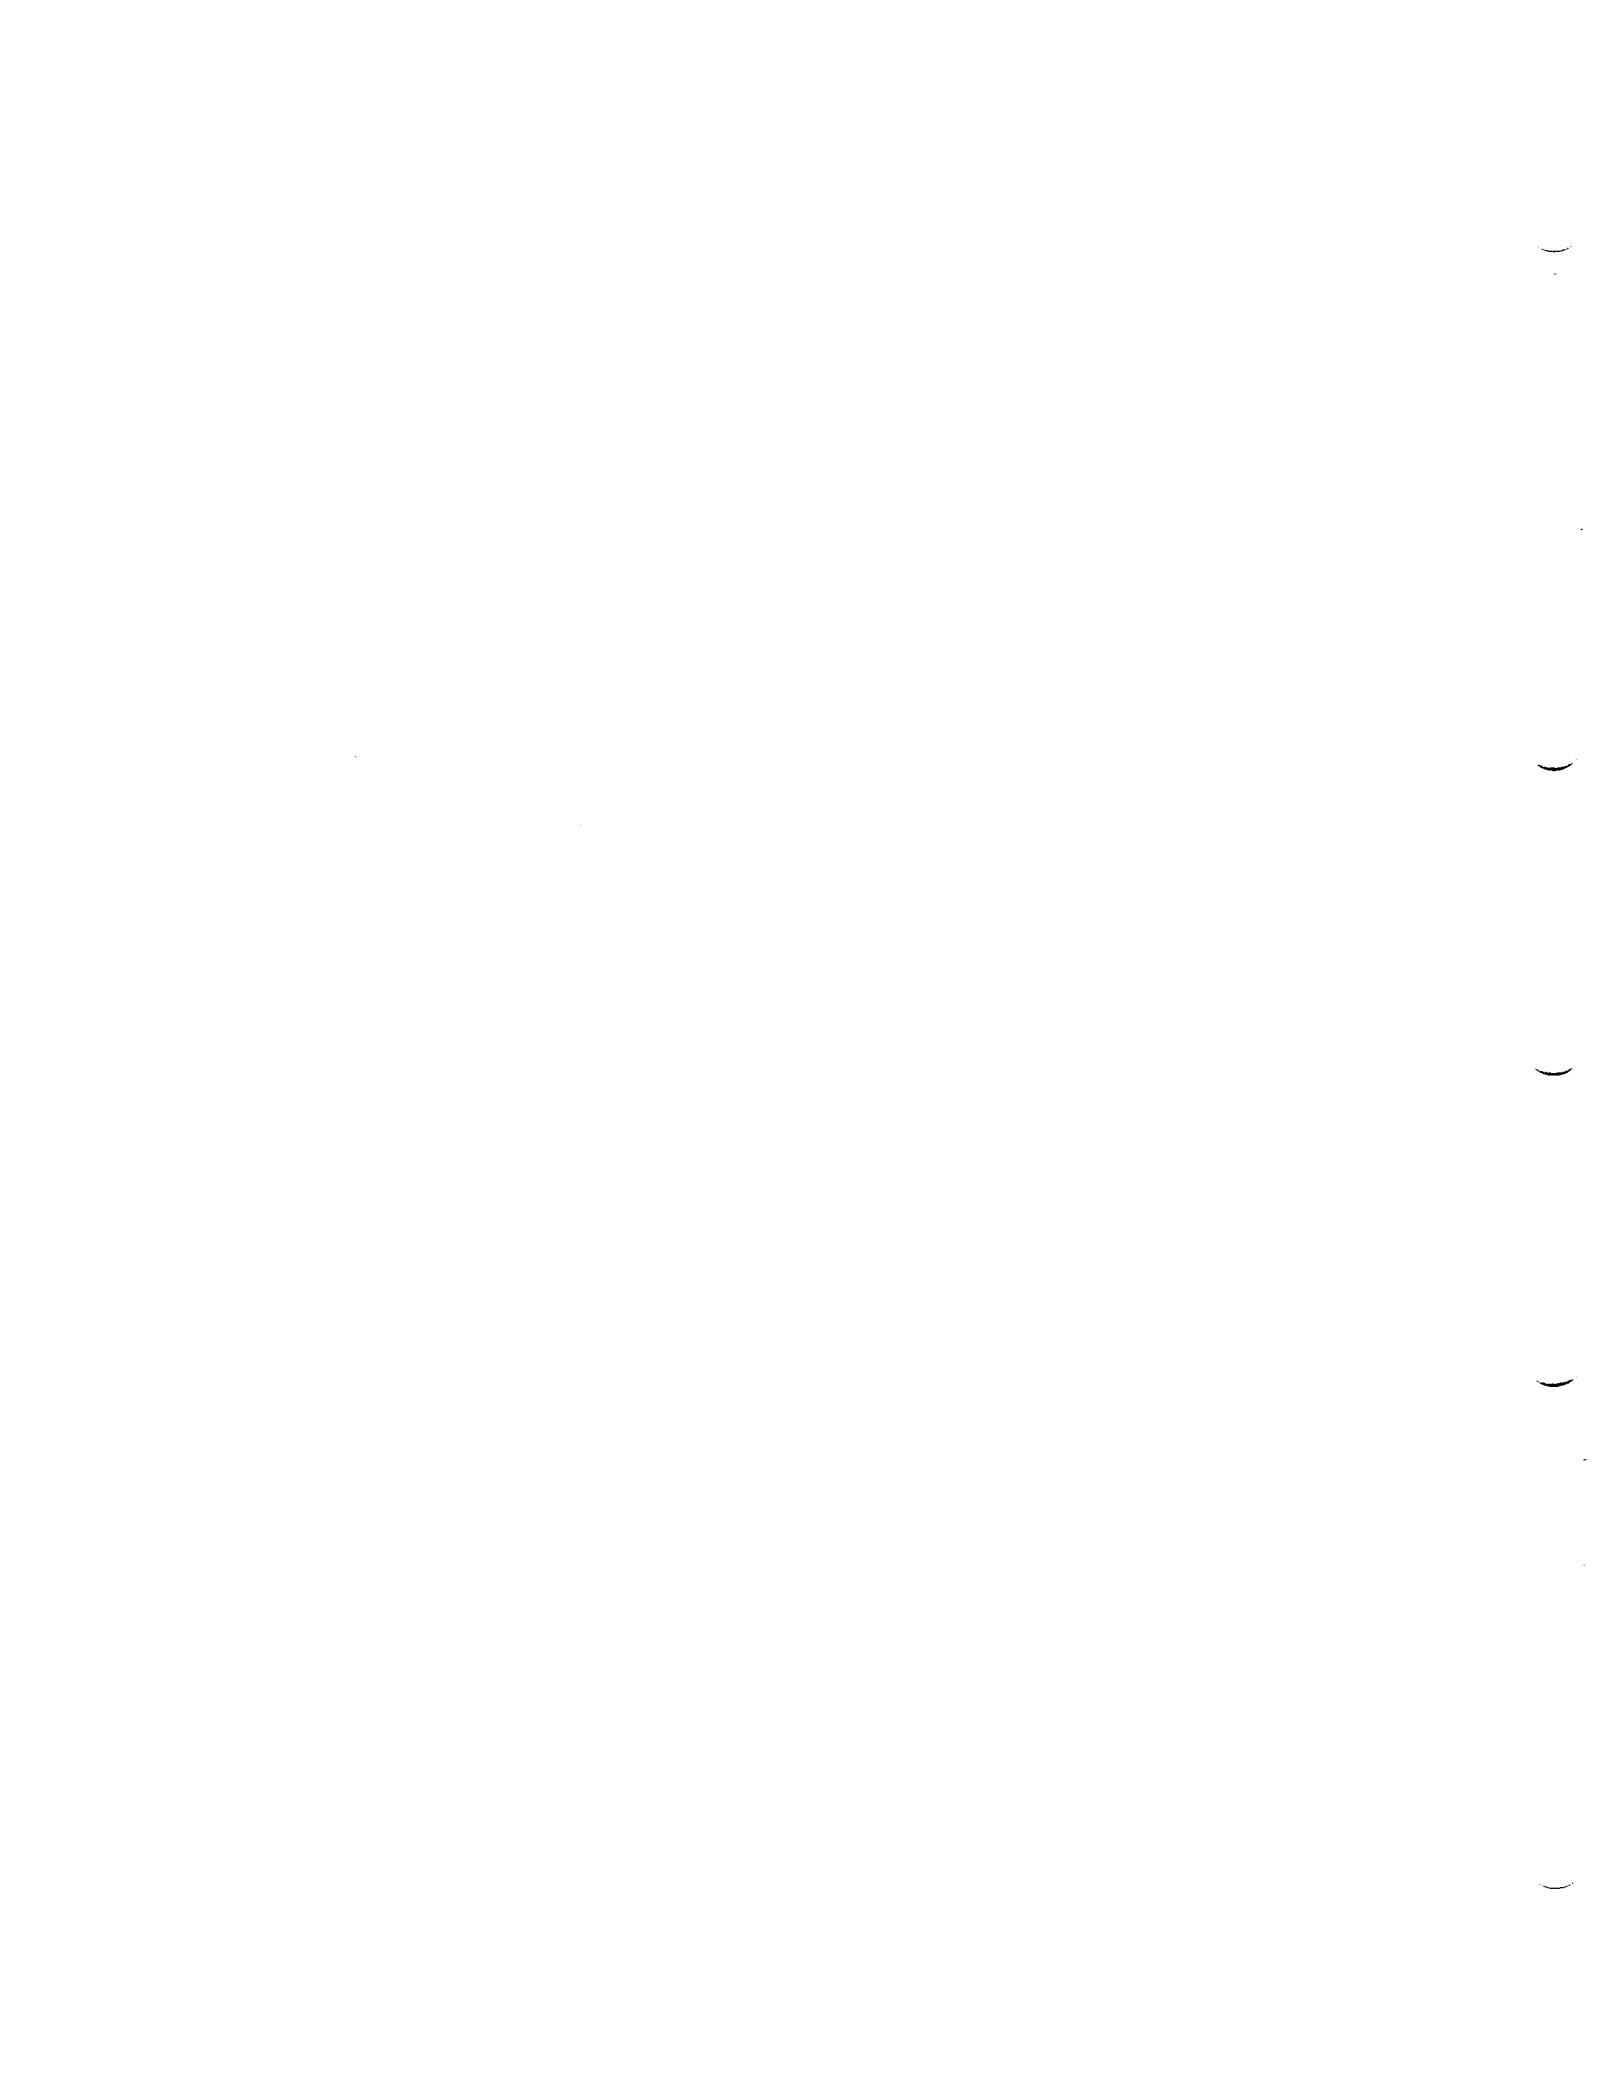

## 2.2 Preparing The System Configuration Worksheet

In Figure 2-1 a completed worksheet is shown for a pre-defined RTE file (EXERR1.BIN) in which a compilation of known data is cross-referenced to define a monitor (C) modules (KWA, LPA, etc.), and parameters (DVA, VCT, etc.) for the build.

Excluding most of the device/options to simplify the example, the worksheet entries reflect the following system configuration:

1. A PDP11/34 CPU with 64K of memory
2. A full range of memory options (KT, CACHE, PARITY, ECC).
3. A list of 11 device/options with parameters, which include a:
  - (a) KW11-L Line Clock, coded to provide a clock test message every 15 minutes.
  - (b) LS11/LV01 Line Printer Controller and an 80-column 64-character Printer coded to provide 2 passes between each pause.

Using this information as an example of known data compiled by the user, corresponding worksheet entries and required DEC/X11 software are derived as follows.

DEC/X11 System Configuration Worksheet

FIGURE 2-1  
HARDWARE CONFIGURATION LISTING

## 2.2.1 Selecting An RTE File Name

As shown in Figure 2-1, a six-character RTE file name, with a three-character file extension, is created by the user in accordance with the standard defined in the File Code Naming subsection (1.3).

RTE Sample File Name: EXERR1.BIN  
 where: E - DEC/X11 Software Identifier for an RTE  
 XER - RTE Name  
 R - Current Revision Level  
 1 - Current Patch Level  
 .BIN - File Extension Code (.BIN or .BIC)

The next step in the preparation of a worksheet is the selection of an appropriate monitor.

## 2.2.2 Selecting The Monitor Program

As shown in Figure 2-1, Monitor C has been selected for the RTE (EXERR1.BIN) in regard to CPU type, memory size and the number of memory options available. This is in accordance with the criteria set forth in the Processor to DEC/X11 Monitor subsection (3.1).

The known data for the selection of Monitor C is:

1. A PDP11/34 CPU
2. A Memory Size of 64K
3. All memory Options available:
  - Memory Management (KT)
  - Cache Memory (CACHE)
  - Memory Parity Checking (PARITY, ECC)

The final step in the preparation of the worksheet is the listing of all device names, module names, and parameters.

## 2.2.3 Selecting The Device/Option Modules

As shown in Figure 2-1, all device/option names are now listed on the worksheet and all known parameters are entered in the appropriate columns.

Using the device examples previously noted, the following may be initially listed:

1	2	3	4	5	6	7	8	9
DEVICE	MOD	R	DVA	VCT	BR1	BR2	DWC	SRI
KW11-L			177546	100	6	0	1	
LS11/LV01			177514	200	4	0	1	
:	:	:	:	:	:	:	:	:

Column 2 (MOD) may now be filled with appropriate DEC/X11 test module names by referencing an alphabetized listing, contained in the Device to DEC/X11 Module subsection (3.2), which associates each hardware device/option name with a DEC/X11 device/option module.

Thus, for the example, device and module names are associated as follows:

1	2
DEVICE	MOD
KW11-L	KWA
LS11/LV01	LPA
:	:

Using the DEC/X11 module names, the user may now reference the Device/Option Module Abstracts subsection (3.3) to derive: the module revision level (Column 3); all default or required parameters (Columns 4 through 8); and the switch register settings (Column 9) for the coding of additional parameters (e.g., to provide a Line Clock test message at a pre-defined time).

However, prior to describing these entries, it should be understood that, although all parameter values are also contained in the abstracts, these values are subject to change. Therefore, those values obtained by the user from current hardware documentation are primarily recommended for use, if only for the purpose of cross-checking the validity of the parameter values contained in the abstracts.

In any case, for the example, the revision (R) and switch register (SRI) coding is as follows:

3	9	SR1 PURPOSE
R	SR1	
A	4	;code permits test message every 15 mins.
A	010000	;code indicates 80-col., 64-char. printer
:	:	;and 2 passes between pauses.

With these entries the worksheet is completed and the preparation date is entered. The user has defined an appropriate monitor, test modules, and parameters for the Configuration Process. In addition, following the Linking Process, an RTE File Name has been created for the resultant module.

### 3.0 HARDWARE TO SOFTWARE CROSS-REFERENCE DATA

The information in this section allows the user to (1) initially associate a processor type with an appropriate DEC/X11 Monitor (3.1). This is followed by (2) an alphabetized listing of all device/options that are cross-referenced to their appropriate test modules (3.2). The section concludes with (3) an alphabetic listing, via test module names, of device/option module abstracts, which provide a complete summary of associated devices, default and required parameters, and switch register settings (3.3).

#### 3.1 Processor To DEC/X11 Monitor

There are five basic monitor types (A,B,C,D,E) available to DEC/X11 users. However, four of these (B,C,D,E) have been expanded to accommodate API processing and as such have been renamed (F,G,H,I). NOTE: Monitors F, G, H, AND I are to be used only with API systems. Thus, with the similarities just described, nine monitor types are actually available.

In order to cross-reference a PDP11 processor to an appropriate monitor, the user must be completely aware of the requirements of the hardware configuration, as it relates to:

1. PDP11 CPU Type (e.g., 11/34, 11/60, 11/70)
2. Available Memory Size:
  - (a) up to 28K-words

- (b) up to 124K-words
- (c) up to 1024K-words
- 3. Available Memory Options (e.g., KT, CACHE, etc.)
- 4. Available Devices and Options (e.g., Line Printer, Line Clock, etc.)
- 5. Special Operations (e.g., Error Logging, 22-Bit Addressing)

Since one or more of the aforementioned may be the clue to monitor selection, the following material describes the general abilities and restrictions of each monitor in regard to the accommodation of RTE Keyboard Commands (e.g., KTON and KTOFF required for Memory Management Option) and the availability of special operations (e.g., PDP11/60 Error Logging).

Finally, a DEC/X11 Monitor Performance Chart (Table 3-1) concludes the subsection and provides a quick cross-reference between each monitor, the RTE Keyboard Commands, and the special operations.

### 3.1.1 Monitor A

Monitor A is the smallest of the DEC/X11 monitors. As such, it can accommodate only 7 of the 22 RTE Keyboard Commands and has the following abilities and restrictions:

Monitor A can accommodate:

- o NPIR transfers in up to 28K-words of memory.
- o Module Selection (SEL) and Deselection (DES).
- o Module Modification (MOD) and Summary (SUM).
- o Filler Word (FILL) and Switch Register Modification (SWR).

Monitor A cannot accommodate:

- o Running as part of an RTE in less than 12K system.
- o Time Conversions (i.e., clocks, module pass counts, etc.).
- o Memory Management and Cache Options (KT, CACHE).
- o Memory Parity Checking Options (PARITY, ECC).
- o Write Buffer Rotation (ROTON, ROTOFF).
- o Exerciser Relocation (KTON, KTOFF, RUNL).
- o Location Examination (EXAM).
- o Module Mapping (MAP).
- o UNIBUS Mapping (MON, MOFF).
- o Line Printers (LPON, LPOFF).
- o NPIR Transfers in up to 124K-words of memory.
- o NPIR Transfers in up to 1024K-words of memory.
- o 11/60 Error Logging
- o 11/70 Error Logging and 22-bit addressing.
- o Bad Vector Service

3.1.2 Monitor B or Monitor F

Monitor B(or F) can accommodate 15 of the 22 RTE Keyboard Commands. It can perform all of the functions of Monitor A and additionally:

Monitor B(or F) can accommodate:

- o Time Conversions (e.g., clock usage).
- o Memory Parity Checking Options (PARITY, ECC).
- o Write Buffer Rotation (ROTON, ROTOFF).
- o Location Examination (EXAM).
- o Module Mapping (MAP).
- o Line Printers (LPON, LPOFF).

Monitor B(or F) cannot accommodate:

- o Memory Management and Cache Options (KT, CACHE).
- o Exerciser Relocation (KTON, KTOFF, RUNL).
- o UNIBUS Mapping (MON, MOFF).
- o NPR transfers in up to 124K-words of memory.
- o NPR transfers in up to 1024K-words of memory.
- o 11/60 Error Logging.
- o 11/70 Error Logging and 22-bit addressing.
- o Bad Vector Service.

3.1.3 Monitor C or Monitor G

Monitor C(or G) can accommodate 20 of the 22 RTE Keyboard Commands; and can perform all of the functions of Monitors A and B; additionally:

Monitor C(or G) can accommodate:

- o Memory Management and Cache Options (KT, CACHE).
- o Exerciser Relocation (KTON, KTOFF, RUNL).
- o NPR Transfers in up to 124K-words of memory.
- o Bad Vector Service

Monitor C(or G) cannot accommodate:

- o UNIBUS Mapping (MON, MOFF).
- o NPR transfers in up to 1024K-words of memory.
- o 11/60 Error Logging.
- o 11/70 Error Logging and 22-bit addressing.

3.1.4 Monitor D or Monitor H

Monitor D(or H) can accommodate 20 of the 22 RTE Keyboard Commands and perform all of the functions of Monitors A, B and C; additionally:

Monitor D(or H) can accommodate:

- o 11/60 Error Logging.

Monitor D(or H) cannot accommodate:

- o UNIBUS Mapping (MON, MOFF).
- o NPR transfers in up to 1024K-words of memory.
- o 11/70 Error Logging and 22-bit addressing.

3.1.5 Monitor E or Monitor I

Monitor E(or I) can accommodate all of the 22 RTE Keyboard Commands and perform all of the functions of Monitors A, B and C (Monitor D excluded); additionally:

Monitor E(or I) can accommodate:

- o UNIBUS Mapping (MON, MOFF).
- o NPR transfers in up to 1024K-words of memory.
- o 11/70 Error Logging and 22-bit addressing.

Monitor E(or I) cannot accommodate:

- o 11/60 Error Logging (Monitor D only).

COMMANDS & OPERATIONS	A	*B(F)	*C(G)	*D(H)	*E(I)

## 3.2 Device To DEC/X11 Module

This material provides an alphabetized listing with which the user may cross reference a known device/option hardware name with an associated DEC/X11 test module name. Once the name of the test module is derived, it may be used to find (in subsection 3.3) an alphabetically arranged abstract of the module which provides a complete summary of its use.

#### 4.0 DEC/X11 RELEASE, DISTRIBUTION, AND UPDATE NOTES

The following four subsections provide information related to current release data, media distribution, monitor library and test module updates, and special environmental considerations (e.g., APT, XXDP+, ACT, etc.) for the operation of DEC/X11 Software.

##### 4.1 Current Releases (Monitor Library, Config/Linker)

The current release of DEC/X11 Software and Documentation is as follows:

CXMONA - MONITOR LIBRARY

CHUXCA - CONFIGURATOR/LINKER

CXQUAB - DEC/X11 USER'S MANUAL

FOR OPTION MODULES REFER TO OPTION MODULE ABSTRACT SECTION OF THIS MANUAL.

##### 4.2 DEC/X11 Distribution

DEC/X11 software is distributed on XXDP+ media (except TU-60 cassette) and also Papertape (except the Configurator/Linker). Refer to XXDP+ USER'S MANUAL for media names.

##### 4.3 Monitor And Module Release Notes

SPECIAL NOTE: All RTE's configured using monitor CXMONA? MUST include at least one BKMOD unless patch CXMONA2 is used !!!!

The following locations can be changed by the operator:

Loc. 1044 contains the relocation constant. Must be in PAR format(e.g., 200 = 4K). Default is to 4K.

Loc. 1110 contains the maximum number of hard errors allowed before an option module is dropped. Default value is 20 errors.

Loc. 1112 contains the maximum number of soft errors allowed before an option module is dropped. Default value is 40 soft errors.

Loc. 1114 contains the maximum allowed time between end-of-passes per option module. Default value is 15 minutes.

##### ECC Memory:

If ECC memory exists on the system, ECC will be controlled in the following manner:  
POFF Command turns off ECC and Disables TRAPS.  
PON Command turns on ECC and Enables TRAPS.

In order to turn on either ECC or TRAP, but not both, you must modify the contents of locations PONOF+266 and PONOF+272 (PONOF can be found in the Load Map), to one of the following values:

Trap On Trap Off  
ECC Off ECC On

Loc. PONOF+266 000000 000001  
Loc. PONOF+272 000003 000000

Important: After modifying these locations you must type a POFF command followed by a PON command, so that the ECC Memory is actually in the desired state.

In addition if the ECC Memory is an 11/70 MK11 with the Memory's CSR not in the I/O Page and monitor E or I is used then ICSR00+126 and ICSR00+132 must be modified as follows:

TRAP On TRAP Off  
ECC Off ECC On

Loc. ICSR00+126 000000 000001  
Loc. ICSR00+132 000003 000000

SBKMOD and NBKMOD modules' cannot not be deselected while they are actively running(selected and active).

##### 4.4 Special Environments

There are two special environments under which DEC/X11 exerciser programs may be run in which operational differences will be encountered. They are: (1) when running an RTE as a chain file under the control of an XXDP+ monitor and (2) when running an RTE under control of an APT monitor. The following material describes the differences.

#### 4.4.1 XXDP+ Chain Mode

The following material assumes that the user is familiar with XXDP+ Chain Mode operations as described in the XXDP+ USER'S MANUAL. When a DEC/X11 Run time Exerciser(RTE) program(filename.B1C) is included in an XXDP+ chain file(filename.CC), the loading, starting, and execution of the RTE incurs the following changes.

1. When the XXDP+ monitor is loaded and chain mode is initiated(via .C filename), the RTE file will eventually be automatically executed(i.e., a RUN command will not be required).
2. When an RTE is running in chain mode, all RTE keyboard commands will operate in the same manner described for stand-alone operation.
3. As with all programs run in chain mode, the RTE must periodically return to the XXDP+ monitor. However, a return will only occur when the RTE is in lowest memory(due to relocation or not) and a system-end-of-pass occurs(i.e., all I/O option modules have individually completed an end-of-pass). When the proper number of returns have been made(as defined by an XXDP+ pass-count), the XXDP+ monitor will terminate the execution of the RTE and initiate the execution of the next program in the chain file.

Thus a return is caused under the following conditions:

- (a) If a Memory Management option(KT) is not available(or disabled), the RTE cannot be relocated and will therefore remain in lowest memory. Thus, a system-end-of-pass will cause a return to the XXDP+ monitor.
- (b) If the KT is both available and enabled, the RTE will relocate through memory as described in the DEC/X11 USER'S Manual. That is, via both constant and random(if selected) relocation, cycling under chain mode occurs in 28K segments instead of the normal 4K segments. In any case, when the RTE is in lowest memory and a system-end-of-pass occurs, a return to the XXDP+ monitor will occur.
4. Finally, if the RTE file is running when a Control C(C) is entered, the RTE will stop and Command Mode(CMD) will be entered. This however, will not affect the XXDP+ pass-count. Thus, when a RUN command is subsequently entered, the RTE will be restarted and the incrementation of the pass-count will continue until a value specified in the chain file is reached. At that point the XXDP+ monitor will terminate the execution of the RTE and the next program in the chain will be loaded.

#### 4.4.2 APT Control

The following material assumes that the user is familiar with APT Control as described in the APT-11 Manual(APT11.MAN)

When a DEC/X11 Run-Time Exerciser(RTE) is created for use under APT control, the following initial build requirements and operational differences must be noted.

##### Configuring for APT

When an RTE is initially configured for use under APT control, the following requirements must be adhered to:

1. When constructing the Configuration Table(C-Table), ensure that all required Background Modules(BKMODS) are enired last. This is necessary because BKMODs are the slowest group of modules to be sorted by the DEC/X11 monitor. Thus, proper configuration ensures that no discrepancies will occur when a comparison is made between the module-map listing(in the E-table) and the actual position of the modules in the module listing.
2. When entering a desired DEC/X11 APT monitor name(i.e., F, G, H, or I) in the C-table, be aware that each name(respective) reflects the API equivalent of a basic DEC/X11 monitor(B,C,D,E). A DEC/X11 APT monitor should be selected as follows:
  - o Monitor F is for non-KT systems(e.g., 11/03, 11/04, etc.)
  - o Monitor G is for KT systems (excluding 11/60 and 11/70)
  - o Monitor H is for 11/60 systems.
  - o Monitor I is for 11/70 systems.

**APT Interface Locations**

The following defines the interface differences encountered when running an RTE under APT control:

1. APT Parameter Block Word 4: This location contains a value which defaults the runtime of the longest test to 15 minutes.
2. APT Parameter Block Word 5: This location contains a value which defaults the runtime of the first test to 2 minutes.
3. APT Mailbox Word 4: This location contains the module pass count. The contents of the location are incremented every time the slowest of the resident and selected IOMODS completes an end-of-pass. BKMODs will not affect the incrementation of the counter as long as IOMODs are resident and selected. However, if BKMODs are the only resident or selected modules, each BKMOD module will increment the counter when it completes an end-of-pass.
4. APT E-Table Word 1: The lower byte of this word is defaulted to a value of 001 to define APT Mode as opposed to stand-alone. The upper byte defaults to a value of 000 which makes the assumption that a UUT Console terminal is available.
5. APT E-Table Word 3: The lower-byte of this word defaults to a Soft Error Limit value of 37 octal while the upper-byte is defaulted to a Hard Error Limit of 001. These values respectively indicate that the occurrence of 37 soft errors or 1 hard error within a module, will result in the reporting of a fatal error to APT. Soft errors or if desired the value of each byte, may be adjusted up to the maximum of 37 octal. However, the hard error limit should only exceed during debug, since this will change the pass/fail criteria of the RTE.
6. APT Module Map: Each byte in the module map provides a device-count-entry for each module. If the byte is 0, the module is deselected. The formatting of a device count is described in the DEC/X11 User's Manual. However, the following provides several examples of device count entries:
  - o A 000 octal entry will deselect the module.
  - o A 001 octal will select module to test device zero.
  - o A 002 octal will select module to test device one.
  - o A 003 octal will select module to test devices zero and one.

Finally, in order to monitor or modify any of the aforementioned words, an appropriate absolute address may be derived by adding the value contained in location 44 to one of the following values:

- o APT Parameter Block Word 4: 004(longest test)
- o APT Parameter Block Word 5: 006(first test)
- o APT Mailbox Word 4: 022(module pass count)
- o APT E-Table Word 1: 034(APT Mode/UUT Terminal)
- o APT E-Table Word 3: 040(soft error/hard error)
- o APT Module Map: 100(module device counts)

Example: Find the absolute address of APT Mailbox Word 4 (location 44=5764 octal):

```

5764 = Contents of location 44
+ 22 = APT Mailbox Word 4 value.
-----  

6006 = Absolute Address of APT Mailbox Word 4.

```

**Error Reporting Under APT**

When a module detects a fatal error, four of the five module-name characters(excluding the Rev. letter) are reported to APT. For example, if Module RKBA1 detects a fatal error, RKB1 is reported to APT.

If the monitor detects a fatal error, a special four-letter code is reported to APT. The first two letters of the code(MD) indicates monitor detection while the remaining two define the type of fatal error detected, as follows:

MOXX
CQ Control Queue Overflow Error
TQ Type Queue Overflow Error
PE Parity Error(Memory, Cache, or ECC)
ME Memory Error
KT Memory Management(KT) Trap Error.
SE System Error(Trap through location 04 or 10)

If a Console Terminal device is available, all error messages will be output to the Console device. This includes any fatal error message which will also evoke the output of a run summary prior to terminating the RTE.

PROBLEM:

Some new module revisions listed in CXQUBC0 were not acutally released at that time.

SOLUTION:

The effect of said modules on the manual should be reversed.

page 68-71 : delete these pages.

page 88 : the revision level of TMA is I, not J.
